

DOES YOUR COURT NEED A RESURFACER BASE COAT?

We'll cover the techniques for applying a Resurfacer base coat in another article. For now, let's discuss whether or not your court needs a base coat. A Resurfacer base coat has one function and one function only: filling rough areas on a tennis court surface. It is not used in the same way a base coat on a wall would be used. It is not a primer for better adhesion, or a base for better color development of the final paint coats.

If you are applying color-coatings over new asphalt, old rough asphalt, or a court that has a large percentage of the surface covered with patches, you will need at least one coat of our EnviroFill Resurfacer. It works better than color-coatings in these situations for two reasons: It is specifically designed for filling and it is a little cheaper than the color-coatings. Replacing expensive pigments (in color-coatings) with heavy fibers and other fillers, EnviroFill has twice the filling quality and cost about 10% less.

You, most likely, will not need Resurfacer if your tennis court already has a painted surface largely intact, or if you are applying court coatings on new or unpainted concrete.

If you have any questions about your court, don't hesitate to call us: (800) 983-1357.
